Investigation of the effect of

and fatigue properties, remain unchanged. Since zinc oxide, zinc hydroxide, and zinc carbonate have the same specific surface and particle size, the elevated activity of the investigated substances as compared to that of zinc oxide, is explained by the fact that the zinc oxide, formed in their decomposition during the vulcanization process, is more effective than its commercial counterpart. There are 3 figures and 4 tables.

AUTHORS: Isayev, A. I., Professor, Doctor of Technical Sciences; Gorbunova,
 V. N., Engineer

TITLE: The plastic deformation process in chip-formation zone studied by
 high-speed photo-camera

PERIODICAL: Vestnik mashinostroyeniya, no. 5, 1960, 57-59

TEXT: Information is presented on a new method developed at TeNITMASH for
 observation of metal flow at the cutting edge of tools. The method's novelty
 consists in the use of a heat-treated 8-10 mm thick glass screen preventing metal
 from flowing toward the recording camera, which could not be prevented in the
 numerous investigations carried out previously in the USSR and abroad. The method
 has been suggested by Professor A. I. Isayev (Author's Certificate no. 115008,
 1959); the motion picture techniques were developed by Professor A. I. Isayev
 and Engineers V. N. Gorbunova and A. A. Gorlova. Operator P. M. Kosov participat-
 ed in the preparation of films. The device (Fig. 1) includes a microscope in the
 place of the camera lens; the metal specimen (1) is thrust tightly to the trans-
 parent screen (2) with surface carefully polished [to class 13 finish per GOST]

The plastic deformation process ...

(GOST) 2789-59 standard]; the cutter (3) is fixed immobile in a special attachment. Film shooting was performed on milling machine table, the cutting process simulated planing. The specimen was etched to reveal metal structure. Lighting was tried in two different ways - first by a K22 (K22) movie projector tube at 45° angle to the specimen, mounted together with a double-lens condenser, then with an opaque OM-21 (O1-21) reflector illuminator. The first arrangement was only sufficient for cutting with up to 1.2 m/min and up to 200 shootings/sec, the metal structure components were colored not as usual under metal microscope, and the system was complex to adjust. The opaque light combination was better, though the field of vision decreased. It permitted a cutting speed of 6 m/min and 2,000 shootings/sec. Three different cameras were used: an "Askaniya" (24-30 shootings/sec), and a "ZL-1" (500 to 18,000 shootings/sec) for higher cutting speed. Photographs of several films show that the distortion of images is only slight, and the method opens new possibilities for investigations of the metal-cutting processes and designing new and more efficient tools. There are 6 figures.

Title : Experiment in the Application of Concentrated Irrigation
of Cotton Plant in Vakhshskaya Valley

Orig Pub : Khiopkovodstvo, 1957, No 12, 32-38

Abstract : In accordance with the proposal of the Moscow Institute
of Water Management Engineers, the old system of cotton
irrigation in a number of kolkhozes of Tadzhik SSR (irri-
gation of small isolated fields during several days) was
substituted with a new system of concentrated waterings
in which the area of a simultaneous watering was increa-
sed by two-three times and was brought to the area of the
daily performance of the tractor. Application of concen-
trated irrigation provides a simultaneous readiness of
the soil of the plot, decreases the interval between the

from Various Harvestings.
(Soderzhaniye karotina v odnoletnikh i mnogoletnikh
travakh razlichnykh ukosov).

Orig Pub : Sb. nauchn. -issled. rabot stud. Stavropol'sk. s.-kh.
in-t, 1956, vyp. 4, 84-86.

Abstract : The carotene content was determined in the hay of rye-
grass, sainfoin, alfalfa, winter and perennial rye
during the 1, 2, 3 harvesting. The highest carotene
content was in the sainfoin hay from all harvestings:
83.1-101.8 milligrams per 1 kilogram, and in the

AUTHOR: Gorbunsov, A.F., and Babis, R.S., Engineer

TITLE: Concerning the Article by K.K.Balashov "The Variant Method of Designing Transformers" (Po povodu stat'i K.K.Balashova "Variantnyy metod rascheta transformatorov")

PERIODICAL: Vestnik Elektropromyshlennosti, 1959, Nr 3, pp 73-74 (USSR)

ABSTRACT: This is a brief discussion of an article published in the Vestnik Elektropromyshlennosti, 1958, Nr 8. The contributors are very critical of the article and consider that the method proposed has no advantages over existing methods whatever and that it cannot be used under practical factory conditions.

A004/A101**AUTHOR:** Gorbuntsov, V. G.**TITLE:** Preparing the surfaces of small parts prior to coating and ultra-sonic cleanings of pipelines**PERIODICAL:** Referativnyy zhurnal, Mashinostroyeniye, no. 7, 1962, 31-32, abstract 7B169 (V sb. "Primeneniye ul'trazvuka v tekhnol. mashinostr.", no. 3, Moscow, 1960, 101-104)**TEXT:** The author presents the results of investigating the most efficient technology of cleaning small parts prior to protective coating and the ultrasonic cleaning of pipelines. For the tests a component nomenclature of 150 items was compiled and 6 compounds were selected for chemical pickling. The best results were obtained with a solution of the following composition: 700 mg/l hydrochloric acid, 300 mg/l water and 10 g/l $\text{Na}_2\text{S}_2\text{O}_5$ (PB-5) or $\text{Na}_2\text{S}_2\text{O}_8$ (PB-8) inhibitor (the application of the $\text{Na}_2\text{S}_2\text{O}_5$ [IA] or $\text{K}_2\text{S}_2\text{O}_8$ [KS] inhibitors is also possible), at room temperature, the pickling time being 1-7 min. After pickling, the components were washed and degreased in the ultrasonic Y3B-3 (UZV-3) bath containing a solution of the composition (g/l): calcined soda - 5 - 15, sodiumtriprophosphate - 5 - 15 and 3 g/l $\text{OP}-7$ (OP-7) or $\text{OP}-10$ (OP-10) at 20 - 60°C, the treatment Card 1/3 ✓

Preparing the surface of small parts ...

S/123/62/000/007/008/016
A004/A101

lasting not longer than 1 min. Then the components were washed in cold running water and passivated in a solution of chromic anhydride (250 - 300 g/l) and phosphoric acid (100 g/l). The components were then washed again and dried in cold compressed air. The components treated in such a way were parkerized by the hot and cold method. Corrosion tests of the components yielded positive results. The investigation of the ultrasonic technology of cleaning pipes and pipelines was carried out in the UZV-3 and UZV-4 baths (for pipes of up to 1 m length) and in a test bath with six magnetostriuctive MC-6 (PMS-6) converters, supplied from two Y3F-10 (UZG-10) generators (for large-size components). A good surface finish of the pipes was obtained with chemical pickling in the following solutions (g/l): 1) 70 - 80 nitric acid, 80 - 100 sulfuric acid and 40 - 50 hydrofluoric acid, 1 - 1.5 carbon disulfide; 130 - 140 nitric acid, 80 - 100 sulfuric acid, 40 - 50 hydrofluoric acid, 1 - 1.5 carbon disulfide (the maximum pickling time for pipes as delivered was 20, for pipelines 40 minutes). 2) 200 - 300 nitric acid, 40 - 50 hydrofluoric acid (treatment time - 10-40 min, at room temperature). Then the pipes were treated in an ultrasonic bath with a solution of the following composition (g/l): 30 sodiumtriprophosphate, 5 - 15 calcined soda, 3 OP-7 or OP-10 (temperature 40 - 60°C). The cleaning time with ultrasonics was shorter in comparison with the cleaning applied in the bulk

TITLE: Measurements of the light-scattering matrices in the ground layer of the atmosphere

SOURCE: AN SSSR. Izvestiya. Fizika atmosfery i okeana, v. 1, no. 12, 1965,
1279-1288

TOPIC TAGS: atmosphere optics, light scattering, ground layer, photoelectric telepolarimeter, scattering matrix, atmospheric scatter, photometer, photometry

ABSTRACT: A description is given of the instrumentation and procedures used at the Zvenigorodskaya Station in the period 1959-1961 to investigate the component of the light-scattering matrix attributable to the air in the ground layer. The scattering matrix was studied in different regions of the spectrum and under different atmospheric conditions. Earlier determinations of the total scattering matrix and its angular dependence had been made by Rozenberg and associates in 1958 using photographic and visual photometry and subsequently confirmed in the more comprehensive investigations conducted by Pritchard and Elliott in 1960 using photoelectric instrumentation. (Pritchard, B. S., Elliott, W. G. Two instruments for atmospheric optics measurements. JOSA, 50, no. 3, 1960). The instrument used

ACC NR: AP6001975

in the most recent Soviet experiments, as modified by N. D. Rudometkina, consisted of an illuminator with a control photometer and photoelectric telepolarimeter set at different angles. Measurements showed that average instrument error did not exceed $\pm 3\%$, while the probable measurement error was $\pm 10-15\%$. While the measurements did yield some information on the behavior of individual components of the scattering matrix, the results were considered inconclusive. Additional and more precise measurements were recommended. Orig. art. has: 7 formulas and 7 figures.

AUTHORS: Rabinovich, I. B., Gorbushenkov, V. A. SOV/2c-12c-3-36/67

TITLE: The Isotopic Effect in Critical Temperature (Izotopnyy effekt v kriticheskoy temperature)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol. 120, Nr 3, pp. 566-569 (USSR)

ABSTRACT: The present paper compares the critical temperatures T_k of 11 deuterium compounds with the analogous hydrogen compounds. Short reference is made to the representation of deuterium compounds. The materials to be investigated are carefully cleaned and degassed. T_k was determined from the vanishing and the occurrence of meniscus. With each pair (deuteron compound and the hydrogen compound analogous to it) 20 measurements were carried out. Besides the differences $\Delta T_k = T_{k,H} - T_{k,D}$ also the absolute values of T_k were determined as long as this value did not exceed 300°C . Above 300°C only ΔT_k was determined. In all substances investigated the quadratic error committed when determining ΔT_k amounted to about $0,1^\circ$. If the light isotope is replaced by the heavy isotope, T_k is always reduced. Also in the case

Card 1/3

The Isotopic Effect in Critical Temperature

SOV/20-120-3-36/67

of previously investigated substances (with the exception of helium and hydrogen) an isotopic effect with the same sign was observed. Thus, the law $T_{k,D} < T_{k,H}$ is apparently of general validity for the various classes of inorganic and organic compounds within the range of medium temperatures. By applying the known relations $a = 27 R^2 T^2 / 64 P_k$ and

$a = 9 RT_k V_k / 8$ (where a denotes Van der Waal's (Van-der-Vaal's) constant), $a_D/a_H = T_{k,D}^2 P_k / T_{k,H}^2 P_k$ and $a_D/a_H = (T_k V_k)_D / (T_k V_k)_H$ is obtained. Thus it holds for the isotopic analogues of water that $a_D/a_H = 0.989$. Various details are then discussed. The isotopic effects discussed and thus also the conclusion drawn as to the reduction of Van der Waal's (Van der Vaal's) interaction on the occasion of the replacement of the light by the heavy isotope must in no case be extended to the range of low temperatures. At the temperatures of liquid helium and hydrogen the replacement of the light isotope by the heavy one leads to an intensification of Van der Waal's (Van der Vaal's) interaction, which is the opposite to what takes place at medium temperatures. In conclusion, the authors thank A. I. Brodskiy, Corresponding Member, AS USSR for his discussion of the results obtained, and they also express their
